A safety net for your data.

Sevjala

LAN-first database backup and recovery
for small offices running MySQL or MariaDB.

A database fully enclosed in a fishing net, gathered above and connected to a USB-inspired fishing rod. A visual metaphor for supported, recoverable data.

Hand-drawn reconstruction of the owner-selected Flow concept.
Mark, lettering, palette and usage rules approved on 2026-11-10.

Which file for which job: docs/reference/brand.md

From concept to clean geometry

The supplied image is the reference. The SVG is an editable reconstruction.

Supplied raster concept

Clean reconstructed full mark

Derived compact mark

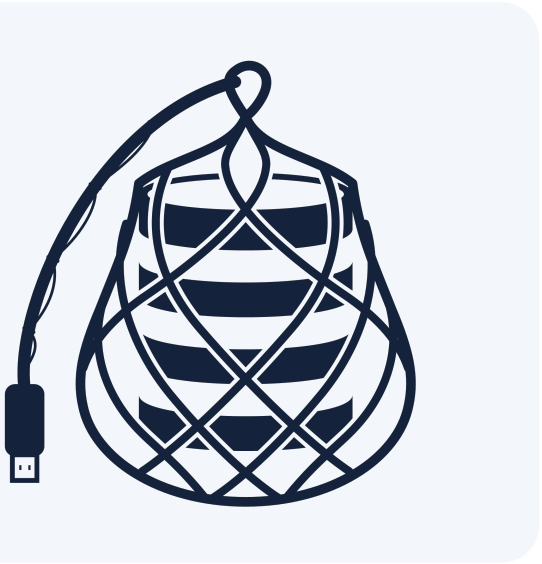

Geometry regularized; tiers, full net and USB rod retained. Reconstructed artwork is not pixel-identical.

Preserved: the full enclosing net, stacked database, gathered loop and USB fishing rod. Regularized: mirrored mesh curves, tier spacing, stroke weight and the USB-to-rod connection.

The source JPEG in source/originals/ is unchanged. Every file in svg/ is vector shapes and local masks: no tracing, no embedded raster.

One identity, three levels of detail

Use the most detailed version that stays clear at its final size.

Full mark

Main symbol. Four database tiers and detailed net; use at 128px or larger.

Compact mark

Three tiers, fewer net strands and a simpler fishing line; from 64px.

Micro mark

32-unit drawing, no rod guides or USB contact dots. Below 64px, down to 16px icons.

Sevjala

Horizontal and stacked lockups pair the full symbol with outlined Plus Jakarta Sans Semibold lettering, tracked -0.012em. They are new lockups, not recovered historical artwork.

Calm, clear, dependable.

Navy follows the supplied concept. Blue is the dashboard accent. Values live in brand/tokens.json.

Net Navy

#14233B

Primary logo ink

Sevjala Blue

#2457C5

Blue logo variant; light-theme UI accent

White

#FFFFFF

Background / reverse artwork

Sevjala

Plus Jakarta Sans Semibold: the wordmark. Regular and Semibold are bundled under the SIL Open Font License; delivered SVG lettering is outlined.

Application typography

The dashboard keeps the system UI font for everything except the wordmark. Status green, yellow and red remain operational signals, separate from the brand mark.

Give the net room to breathe.

Rules for placed artwork: logos and lockups shown as images.

Clear space: 1/4 of visible mark height

Choose contrast

Navy or black on light backgrounds. White on dark backgrounds. Use the supplied transparent artwork.

Preserve the enclosure

Keep the net around the entire database and retain the USB rod. Use compact or micro files when details become small.

Preserve proportions

Scale uniformly. Avoid stretching, cropping, gradients, shadows, extra strands, or thinning individual strokes.

Minimum widths for placed artwork: full symbol 128px, compact 64px, horizontal lockup 400px; smaller marks use the micro symbol. At 16px the artwork is an identity cue. UI chrome, such as a 32px header mark beside live text, follows docs/reference/brand.md.

Ready for desktop and browser.

Check each icon in the actual platform before shipping it.

App icon and favicon

A white micro mark on a navy tile, used for the program icon, the browser tab and the tray.

Tray

The tray shows the app tile at 32px with the status drawn as a dot in its corner, ringed in white. Transparent micro marks, below, suit a placement on a known background.

One kit, rebuilt from the repository.

brand/kit/source/build.py regenerates the artwork, previews, review sheets and this guide from brand/tokens.json.

What is in the kit

svg/ - full, compact and micro marks; outlined wordmarks; horizontal and stacked lockups; app tile.

png/ - transparent previews of every SVG, 2048px wide (2400px for wordmarks and horizontal lockups).

source/ - editable geometry, the builder, pinned dependencies, licensed fonts and the original concept.

reference/ - visual comparisons, curve details, small-size checks and the record of the last PDF review.

Using the identity

The product backs up databases to other PCs over the LAN. The USB rod is a visual metaphor; it does not imply that a USB disk is required or that USB backup is the primary workflow.

Status colours stay separate from the mark: the tray and the dashboard draw the status as a dot beside it.

Colours in the code map to tokens in brand/tokens.json; make brand-check fails on drift and on a colour with no token.
